Subject: Procurement procedure reference No. 15.CAT.OP.070: "Direct services contract for the provision of a study on the design of power management system for land platform" - CLARIFICATIONS 3

3.1

Question:

On Question 2.1 you answer „The main result that is to be part of the study is the development of new optimized power management software and hardware architectures.” How does that fit to the statement “neither the study nor the Executive Summary shall contain any confidential/proprietary information?” If we carry out the study we cannot provide you for example the source code or the simulation. Or do you mean only the results of the work?

Answer:

The scope of the contract does not concern the development of a software but the development of software architecture. Therefore, EDA does not require to receive source codes, but a full description of the software architecture. This comprises software elements, relations among them, and properties of both elements and relations with adequate views (operational, system and technical) and a proof why the proposed architecture could be considered as a new optimized power management software architecture and hardware architecture. The architectural views must be developed accordingly in order to be transferred to the EDA Architecture Repository, of which further details are given in the tender specifications. The study shall contain all the information required by the technical specifications and this information shall not be classified as confidential or proprietary information.
